1. GENERAL DESCRIPTION

IC offers all-in-one chip solution of 544RGBx544 for color dual gate TFT-LCD panel. The driver IC output ports consists of 816 source channels and 24 gate control channels for panel application. This chip incorporated with digital timing generator, source and gate driver, power supply circuit and embedded 3-wire SPI interfaces for function setting. The display data bits sent from MCU via LVDS interface or RGB interface directly related to the pixels of LCD panel. The source output supports 256 gray scale with real 8-bit DAC to get a small output deviation for high color resolution. The power supply circuit incorporated with step-up circuit, regulators and operational amplifiers to generate power supply voltages to drive TFT LCD.

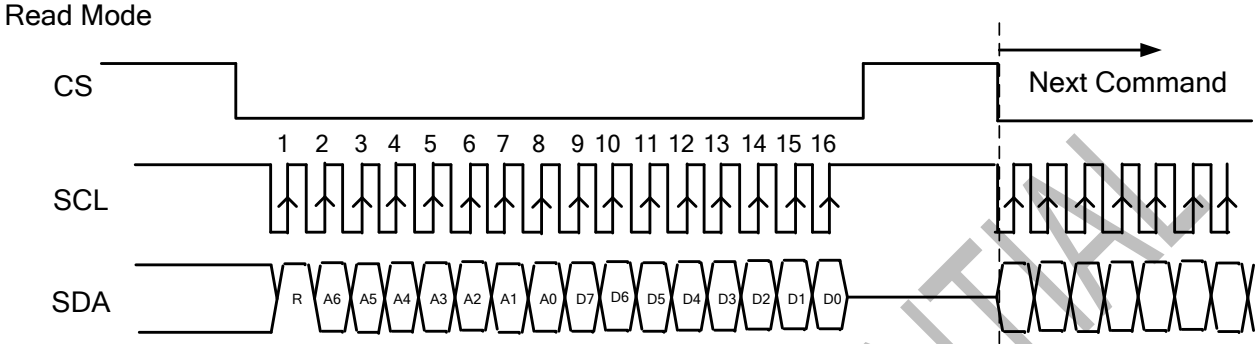
7. COMMUNICATION INTERFACE

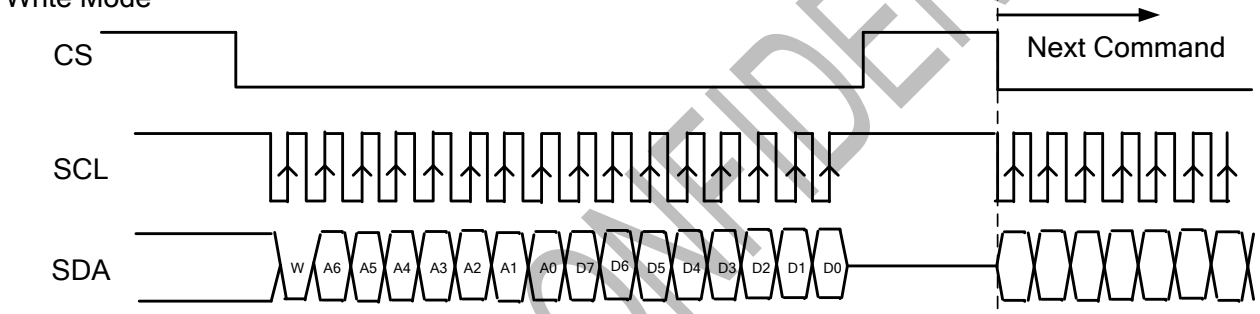
7.1 3-wire Serial Interface

R/W: Read/Write mode control bit.
R/W=1: Read mode
R/W=0: Write mode

Read Mode



Write Mode



a. Each serial command consists of 16 bits of data which is loaded one bit a time at the rising edge of serial clock SCL.

b. Command loading operation starts from the falling edge of CS and is completed at the next rising edge of CS.

c. The serial control block is operational after power on reset, but commands are established by the VSYNC signal. If command is transferred multiple times for the same register, the last command before the VSYNC signal is valid.

d. If less than 16 bits of SCL are input while CS is low, the transferred data is ignored.

e. If 16 bits or more of SCL are input while CS is low, the previous 16 bits of transferred data before then rising edge of CS pulse are valid data.

f. Serial block operates with the SCL clock

g. Serial data can be accepted in the power save mode.

h. After power on reset or GRB reset, it is required 100ms delay to begin SPI communication.

Operating Temperature Range	TOPR	-30 ~ +85	℃
Storage Temperature Range	TSTG	-40 ~ +125	℃

Note:

1. *That the stress exceeds the Limiting Value listed above it may cause the driver IC permanent damage. These values are for stress only. IC should be operated under the DC/AC Characteristic conditions for normal operation. If these conditions are not met, IC operation may be error and the reliability may be deteriorated.*
2. *Parameters are valid over operating temperature range unless otherwise specified. All voltages are with respect to VSS unless otherwise noted.*
3. *Insure the voltage levels of VDDI, VDD, PVDD, always matches the correct relation:*
   3.0V ≦ VDDI ≦ VDD = PVDD ≦ 3.6V
4. *VIN should be less than or equal to 3.6V. (VIN ≤ 3.6V)*
5. *Panel display quality depends on panel loading, and it may have the different performance at low/high temperature.*
6. *To avoid IC being affected by backlight temperature, it is recommended that the backlight led position shouldn't be near the periphery of IC.*
7. *IC can be operated normally at -30~85 degrees, but display quality at high/low temperatures may have different effect according to different panel characteristics.*

2. RGB interface Display signal: DCLK; VSYNC; HSYNC; DE; DR[7:0]; DG[7:0]; DB[7:0]

3: LVDS interface Display signal: DCLK P/N; RX[3:0] P/N
